So God Made a Farmer

“So God made a farmer.”
How do we feed the planet in 2050?

The Earth’s population is expected to grow to 9.7 billion over the next 33 years. That’s a lot of mouths to feed, especially when you consider the vast hunger issues the world faces today.

The numbers are jarring: more than one-quarter of the planet’s 7.5 billion people suffer from malnutrition, and nearly 1 billion are chronically hungry. If that’s not striking enough, there’s this: the world’s population is expected to reach a whopping 9.7 billion by the year 2050. If we’re unable to feed everyone right now, how can we possibly do it when there are billions more people on Earth?
